

SECURING EQUIPMENT

Take the Time to Secure and Test the Securement of Rail Equipment

“Sometimes, tragic accidents happen by design.”

The undesired movement of rail equipment due to a failure in securement can lead to critical incidents. Locomotives and railcars will stay where they are placed when properly secured and tested.

Employees play an important role in preventing the undesired movement of rail equipment by following the Operating Rules, Railroad Safety Rules or other Railroad Instructions and policies that describe the proper steps for securing equipment and testing the securement of the equipment.

Make sure that you and everyone around you is committed to the goal of staying safe by attending to the proper securement of rail equipment.
